DEFINITIONS:

• ILI is defined as one with acute respiratory infection
  – with fever ≥ 38°C (100.4°F) and
  – cough
  – with onset within last 10 days
• SARI is defined as one with acute respiratory infection
  – with fever ≥ 38°C (100.4°F),
  – cough
  – with onset within the last 10 days and
  – requiring hospitalization
• Respiratory failure
  – Represents the failure of the lung to maintain adequate gas exchange
  – Characterized by ABG abnormalities: PaO2< 60 mmHg with or without hypercarbia PaCO2> 46 mmHg (with drop in pH<7.30)

COVID 19 RT-PCR POSITIVE PATIENT

1. Management of any COVID 19 patient mandates the Health Care Personnel (HCP) to be in full Personal Protection Equipment (PPE).
2. Patient is categorized in to three groups:

<table>
<thead>
<tr>
<th>CATEGORY</th>
<th>Type of patients who are provided treatment and care</th>
</tr>
</thead>
<tbody>
<tr>
<td>Group A</td>
<td>Asymptomatic/Patients with mild symptoms&lt;br&gt;RR&lt;24/m &amp; SpO2&gt;94% in room air</td>
</tr>
<tr>
<td>Group B</td>
<td>Symptomatic patient with mild to moderate Pneumonia with no signs of severe disease&lt;br&gt;RR: 24-30/m (or) SPO2: 90%-94% at Room Air</td>
</tr>
<tr>
<td>Group C</td>
<td>Symptomatic patient with Severe Pneumonia with&lt;br&gt;RR &gt; 30/min (or) SPO2 &lt; 90% at Room Air (or) less than 94% with oxygen, ARDS, Septic Shock</td>
</tr>
</tbody>

Note: Calculation tool for predicting critically ill COVID-19 at admission can be used as reference tool. (Development of Validation of Clinical risk score to predict the occurrence of critical illness in hospitalised patient with COVID19. JAMA internal Medicine –published online, May 12/05/2020)

### GENERAL MEASURES AND GUIDELINES

1) **Categorize in to A, B, C based on Symptoms, SpO2 & Respiratory Rate**

2) **Supportive Care:**
- Finger Pulse Oximeter for continuous monitoring of Heart rate and Oxygen saturation
- Start oxygen with Mask at saturation of 94% or lower
- HFNC to be used if there is failed oxygen therapy and Non-invasive ventilation (NIV) to be used appropriately with two limb circuit expiratory filters
- Counselling of COVID19 patients (By Counsellor/psychologist/psychiatrist)
- Normal feeding, no dietary restrictions, good oral hydration
- Maintenance IV fluids (If indicated)
- Maintain blood glucose levels <180 mg/dl.
- If Patient is on ACE inhibitors/ARBs, should be continued
- Avoid using NSAIDs other than Paracetamol Unless Absolutely Necessary
- Avoid using Nebulized drugs to avoid aerosolization of virus. PREFER MDI with SPACER
- Antibiotic selection in case of superadded bacterial pneumonia should be according to institution antibiogram.

### Summary of Treatment of COVID-19 Patients

**Based on Clinical Categories**

#### Mild

- **Antiviral Therapy**
  - Tab Hydroxychloroquine (HCQ)
    - 400mg BD for 1 day if F/B 200mg 1-0-1 X 4 Day for patients in COVID Care Center/Home Isolation (OR)
  - Tab Favipiravir 1800mg 1-0-1 on Day 1 if F/B 800mg 1-0-1 for 6 days for Patients in IC
d

#### Moderate

- **Antiviral Therapy**
  - Inj. Remdesivir 200 mg IV on day 1 followed by 100 mg IV daily for 4 days
  
  (Or) If Remdesivir is not available to start Tab Hydroxychloroquine (HCQ) 400mg BD for 1 day if F/B 200mg 1-0-1 X 4 Day Co-administration of Inj Remdesivir with HCQ or chloroquine should be avoided

#### Severe/Critical

- **Antiviral Therapy**
  - Inj. tocilizumab 8mg/kg (maximum 800 mg at one time) given slowly in 100 ml NS over 1 hour; dose can be repeated once after 12 to 24 hours if needed
  
  (Or) Inj. Itolizumab: 1st dose – 1.6mg/kg dose iv infusion. Subsequent dose: weekly 0.8mg/kg dose infusion over 4 hours if required
  
  - Cap Oseltamivir 75mg 1-0-1 for 5 days
  
  **Steroids**
  - Inj. Methylprednisolone 1-2 mg/kg body wt s/c 1-0-1 X 7 Days
  
  **Anticoagulation**
  - Inj. Enoxaparin 1mg/kg body wt s/c 1-0-1 X 7 Days
  
  **Prone Ventilation**
  - Inj. Ceftriaxone 1gm IV 1-0-1 and can be escalated according to local antibiogram or treating physician
  
  **Consider Sepsivac (if available) 0.3ml intradermal once a day for 3 days in case of septic shock**

### Treatment

**Supportive Therapy**

- Tab Zinc 50 mg 0-1-0 X 7 Days
- Tab Vitamin C 1.5GM IV 6 Hourly X 5 Days
- Tab N-Acetyl Cysteine 1-1-1 in patients with cough

**Group C - Severe/Critical Cases**

<table>
<thead>
<tr>
<th>Treatment</th>
<th>Precautions</th>
</tr>
</thead>
</table>
| **Antiviral Therapy** | Indication for tocilizumab/Itolizumab:-
  
  1. IL-6 levels 50-100 fold higher than normal (Normal range 0 - 9.5pg/ml)
  
  2. Worsening trend of the inflammatory markers (Ferritin, LDH, CRP)
  
  3. Deteriorating clinical condition with worsening of PaO2/Fio2 ratio (more than 25% deterioration from the immediate previous value).

  Contraindications for Inj tocilizumab/Itolizumab
  
  PLHIV, those with active infections (systemic bacterial/fungal), High Serum Procalcitonin, Tuberculosis, active hepatitis, Absolute neutrophil count < 2000/mm3 and Platelet count < 1,00,000/mm3, hepatic and renal impairment; patients on chronic steroid therapy, Paediatric patients ≤18 years old; Pregnancy and, Nursing mothers
  
  - Patient should be continuously monitored
  
  - To start on oxygen with face mask with non rebreathing bag @ 8-10 l/min
  
  - Based on PaO2/Fio2 ratio, high flow nasal oxygen (HFNC)/NIV should be given and if patient deteriorates intubation should be considered and lung protective ventilation to be followed as per ARDSnet protocol
  
  - ABG to be done regularly for monitoring of acidosis and hypoxemia
  
  - Inotropic support (Noradrenaline – titrate according to the mean arterial pressure)
  
  - Correction of acidosis
  
  - Maintain Hb% greater than 8gm%
If Tab HCQ/Tab Favipiravir is contraindicated, then combination of Cap Doxycyclin 100mg 1-0-1 for 5 days + Tab Ivermectin 12mg 1-0-0 for 3 days

Anticoagulation
- Inj Enoxaparin 40mg S/C 1-0-0 x 7 days (if D-dimer is more than 1000ng/ml or X-ray/CT Thorax showing Ground glass opacity)
- Supportive Therapy
  - Tab Zinc 50 Mg 0-1-0x 7 Days
  - Tab Vitamin C 500 Mg 1-1-1 X 7 Days
  - Tab N Acetylcysteine 1-1-1 If Patients Having Cough

Supportive Therapy
- Tab Zinc 50 Mg 0-1-0x 7 Days
- Tab Vitamin C 500 Mg 1-1-1 X 7 Days
- Tab N Acetylcysteine 1-1-1 If Patients Having Cough

STEROIDS
- Inj. Methyl Prednisolone 0.5 -1 mg/kg (or) Inj. Dexamethasone – 0.2 mg /kg for 3-5 Days

ANTICOAGULATION
- Inj Enoxaparin 40mg S/C 1-0-0 x 7 days (if Wt >65kg, 60mg 1-0-1 for 7days)

Iv Antibiotics According to Local Antiagram
- Awake Proning
  - Start on oxygen –Nasal Prongs 2- 5l/min or face mask 5l/min
- Convalascent Plasma
  - 4 to 13 ml/kg (usually 200 ml single dose given slowly over not less than 2 hours)

Supportive Therapy
- Tab Zinc 50 Mg 0-1-0x 7 Days
- Tab Vitamin C 500 Mg 1-1-1 X 7 Days
- Tab N Acetylcysteine 1-1-1 If Patients Having Cough

Hydroxychloroquine (HCQ)
- Dose: Tab HCQ 400MG BD FOR 1 DAY Followed by 200MG 1-0-1 X 4 Days

CONTRAINDICATION FOR HCQ
- QT INTERVAL > 480ms
- Pre-existing cardiomyopathy and cardiac rhythm disorders
- History of Unexplained Syncope
- Retinopathy
- Hypersensitivity to HCQ or 4-aminoquinoline compounds
- G6PD deficiency
- Epilepsy
- Hypokalemia (K⁺ < 3 Meq)

Anticoagulant Agents
- Pro Coagulant factors are increased in COVID-19 infection and associated with increased risk of thrombosis

Pneumonia and sepsis are complicated by DIC, but although COVID-19 patients do have abnormalities of coagulation and are not atypical of DIC.

The most marked abnormality is an elevation of D-Dimer (if D-dimer is more than 1000ng/ml) but without a parallel fall in platelet or prolongation of clotting time, this suggests that local rather disseminated thrombin generation and fibrinolysis is taking place

Dose:
- Inj ENOXAPARIN 40MG S/C Once daily for mild and moderate. Twice daily in severe cases.

Other options:
- Inj Fondaparinux 2.5mg OD SC
- Unfractioned Heparin 5000 Units BD SC

Contraindications:
- ESRD, active bleeding, emergency surgery, platelets < 20,000/mm3, BP >200/120 mmHg)

INVESTIGATIONAL THERAPIES (as per MOHFW)
1. **Remdesivir** (under Emergency Use Authorization) may be considered in patients with moderate disease (those on oxygen) with none of the following contraindications:
   - AST/ALT > 5 times Upper limit of normal (ULN)
   - Severe renal impairment (i.e., eGFR < 30ml/min/m² or need for hemodialysis)
   - Pregnancy or lactating females
   - Children (< 12 years of age)

   **Dose:** 200 mg IV on day 1 followed by 100 mg IV daily for 4 days (total 5 days)

2. **Convalescent plasma (Off Label)** may be considered in patients with moderate disease who are not improving (oxygen requirement is progressively increasing) despite use of steroids. Special prerequisites while considering convalescent plasma include:
   - ABO compatibility and cross matching of the donor plasma
   - Neutralizing titer of donor plasma should be above the specific threshold (if the latter is not available, plasma IgG titer (against S-protein RBD) above 1:640 should be used)
   - Recipient should be closely monitored for several hours post transfusion for any transfusion related adverse events

   **Dose:** Dose is variable ranging from 4 to 13 ml/kg (usually 200 ml single dose given slowly over not less than 2 hours)

3. **Tocilizumab (Off Label)** may be considered in patients with severe disease with progressively increasing oxygen requirements and in mechanically ventilated patients not improving despite use of steroids. Long term safety data in COVID-19 remains largely unknown. Special considerations before its use include:
   - IL-6 levels 50-100 fold higher than normal (Normal range 0 - 9.5pg/ml)
   - Worsening trend of the inflammatory markers (Ferritin, LDH, CRP)
   - Deteriorating clinical condition with worsening of PaO₂/Fio₂ ratio (more than 25% deterioration from the immediate previous value)

   **Dose:** 8mg/kg (maximum 800 mg at one time) given slowly in 100 ml NS over 1 hour; dose can be repeated once after 12 to 24 hours if needed

**Drugs Recently approved by DGCI**

1. **ITOLIZUMAB (An anti-CD6 IgG1 monoclonal antibody)** Indication:
   - IL-6 levels 50-100 fold higher than normal (Normal range 0 - 9.5pg/ml)
   - Worsening trend of the inflammatory markers (Ferritin, LDH, CRP)
   - Deteriorating clinical condition with worsening of PaO₂/Fio₂ ratio (more than 25% deterioration from the immediate previous value)

   **Dose:** 1st dose – 1.6mg/kg dose iv infusion
   - Subsequent dose: weekly 0.8mg/kg dose infusion over 4hours if required based on lung function parameters

   **Contraindication:**
   - PLHIV, those with active infections (systemic bacterial/fungal), High Serum. Procalcitonin, Tuberculosis, active hepatitis, Absolute Neutrophil Count < 2000/mm³ and Platelet count < 1,00,000/mm³, hepatic and renal impairment; patients on chronic steroid therapy, Paediatric patients <18 years old; Pregnancy and, Nursing mothers

   **Side effects:**
   - In trial Infusion reactions have been reported in 15% of the patients
   - In clinical practice also infusion reaction ranged from 12% to 15%
   - Other adverse events include Diaphorea, Pruritus in 7 – 12 % of cases

2. **Tab. FAVIPIRAVIR**

   **Mechanism of action:** It is considered that favipiravir is metabolized in cells to a ribosyl triphosphate form (favipiravir RTP) and that favipiravir RTP selectively inhibits RNA polymerase involved in influenza viral replication

   **Indications:** mild to moderate cases of COVID19 in adults >18yrs old

   **Dose:** 1800mg bid followed by 800mg bid upto maximum of 14days

   **Contraindication:** Hyperuricaemia, severe hepatic & renal impairment, Pregnant women and lactating mothers

   **Side Effects:** increased Uric Acid levels, diarrhea, decreased neutrophil counts, increase in AST/ALT levels

   **Drug Interactions:** metabolised partly by Aldehyde Oxidase(AO) and partly by Xanthine Oxidase(XO). Precautions for co-administration with Pyrazinamide, Repaglinide, Theophyline, Famciclovir

**PRONE VENTILATION**

Early self-proning in awake, non-intubated patients – Moderate cases
- Any COVID-19 patient with respiratory embarrassment severe enough to be admitted to the hospital may be considered for rotation and early self-proning.
- Care must be taken to not disrupt the flow of oxygen during patient rotation

<table>
<thead>
<tr>
<th>Criteria to be fulfilled</th>
<th>Avoid proning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Early self-proning in awake, non-intubated patients – Moderate cases</td>
<td></td>
</tr>
<tr>
<td>Any COVID-19 patient with respiratory embarrassment severe enough to be admitted to the hospital may be considered for rotation and early self-proning.</td>
<td></td>
</tr>
<tr>
<td>Care must be taken to not disrupt the flow of oxygen during patient rotation</td>
<td></td>
</tr>
</tbody>
</table>
Patients with oxygen requirement of >4L
- Normal mental status
- Able to self-prone or change position with minimal assistance
- Hemodynamic instability
- Close monitoring not possible

Typical protocols include 30–120 minutes in prone position, followed by 30–120 minutes in left lateral decubitus, right lateral decubitus, and upright sitting position

Requirements for safe prone positioning in ARDS
- Pre-oxygenate the patient with FiO2 1.0
- Secure the endotracheal tube and arterial and central venous catheters
- Adequate number of staff to assist in the turn and to monitor the turn
- Supplies to turn (pads for bed, sheet, protection for the patient)
- Knowledge of how to perform the turn as well as how to supine the patient in case of an emergency

Contraindications to prone ventilation
- Spinal instability requires special care
- Intra cranial pressure may increase on turning
- Rapidly return to supine in case of CPR or defibrillation

When to start proning in SEVERE CASES?
- P/F ratio <150 while being ventilated with FiO2 >0.6 and PEEP >5 cm H2O
- When P/F exceeds 150 on FiO2 > 0.6 and > 6 PEEP

What portion of the day should patients be kept prone?
- As much as possible (16-18 hours a day)
- Adult patients with severe ARDS receive prone positioning for more than 12 hours per day (strong recommendation, moderate-high confidence in effect estimates)

(ATS-ERS Guideline. Am J Respir Crit Care Med;2017;195(9):1253-1263)

**Oxygen delivery protocol**

- SpO2 < 94% ~ Supplement with nasal prongs or simple face mask at 2-5L/min
- Monitor continuous SpO2 with finger pulse oximetry
- If SpO2 < 94% on simple face mask or nasal prongs, change to non-rebreather mask oxygen (NRB) at 10-15L/min

**Oxygen Delivery Devices & approximate FiO2%**

![Oxygen Delivery Devices & approximate FiO2%](image_url)
**HFNO (High Frequency Nasal Oxygen) and NIV (Non-invasive Ventilation)**

- When oxygen requirement increases to needing NRB, options of High Frequency Nasal Oxygen (HFNO) or NIV should be considered.
- HFNC flow rates to be set from 30 - 60 L/min titrating to maintain SpO2 ≥ 92%

HFNC provides PEEP up to 5-6 cm H2O and can deliver FiO2 up to 100%
- If HFNC non-available or patient not maintaining SpO2 on flow rates up to 60L/min, initiate on non-invasive ventilation (NIV) only with an ICU ventilator with two limbed circuit and expiratory HME filter with a NIV mode available. Caution is to be exercised not to use potable home BiPAP or CPAP machines with single circuit for these patients.

<table>
<thead>

</table>

- Appropriate mask with good seal to be ensured when initiated on NIV. Helmet masks/hoods if available, to be preferred to minimize aerosol contamination.
- Once initiated on NIV, close monitoring of respiratory variables hourly is important.
- Reassess clinical condition hourly, monitor and observe ABG’s 4-6hrly
- Look for signs of clinical improvement in the form of settling tachycardia, improving SpO2, reduced tachypnea and reduced work of breathing.
- On NIV when there are signs of clinical deterioration in the form of worsening sensorium, increased accessory muscles of breathing, raising Pco2, worsening pH on ABG – failure of NIV has to be considered and patient has to be planned for intubation and mechanical ventilation after consent from the family.

**Intubation and Mechanical Ventilation**

- Indication for intubation: ARDS with PaO2/FiO2 < 200
- Worsening respiratory distress even on NIV
- Patient in Shock

**Initial Settings:** Controlled Mode ventilation: VCV (volume-controlled ventilation) or PCV (pressure-controlled ventilation)
- Tidal Volume (Vt) 6-8ml/PBW (predicted body weight)
- PEEP 8 – 18 cmH2O (follow FiO2-PEEP table) to titrate to target SpO2 90-92%
- FiO2 = target SpO2 90-92% with lowest FiO2 possible
- Respiratory rate 14-18/min (maximum up to 35/min)
- Plateau pressure < 30 cmH2O and driving pressure < 16cmH2O
- ABG targets: PaO2 55-80 mmHg, pH > 7.3
- Measure compliance 6hrly ~ Vt in ml /Pplat – PEEP

**Notes:**

- Additional steps: If Pplat > 30cmH2O, reduce Vt upto 4ml/PBW
- If SpO2 < 88% despite ARDSnet protocol: increase depth of sedation
- Optimize secretions clearance/bronchodilation
Indication for prone ventilation:

- Intubation and mechanical ventilation < 36 hrs
- PaO2/FiO2 < 150, FiO2 > 60%, PEEP > 5, Vt 6ml/PBW
- Duration of proning: 12-16 hrs.
- Multiple sessions until favorable trends are achieved.

Adjunctive measures when intubated and mechanically ventilated:

- Antibiotics guided by protocols
- Steps to reduce VAP (ventilator associated pneumonia) by following VAP bundles
- Head-end elevation
- Thrombo-prophylaxis
- Adequate analgesia and sedation

In absence of ABG facility at the hospitals, use SpO2/FiO2 ratio as described in the below table

<table>
